Nutritional Analysis

- The regulations relating to the advertising and labelling of foodstuffs (R146 of 1 March 2010), stipulates that it is mandatory to add a table containing the typical nutritional information for the product, if one or more claims (e.g. "low fat") are made.
- According to R146 the mandatory nutritional information should be determined through chemical analysis in a reputable laboratory utilising SANAS or ILAC accredited methods.
- Mandatory nutritional information must be verified at least once every three years by analysis!

We are offering a 10% discount to clients who submit 5 or more samples for analysis of the minimum eight compulsory nutritional parameters (as per the R146) until 30 March 2014.

These parameters include the following:

- Energy
- Protein
- Carbohydrates by difference/Glycaemic carbohydrates
- Total fat
- Saturated fat (fatty acid profile)
- Total Sugar
- Dietary fibre
- Total sodium

Where specific product matrices/methods have not been validated samples for analysis will be shipped to our network of ISO17025 accredited laboratories in Europe.
